Firewall matrix

Same ports as the ports sheet, laid out as a change ticket. The video row is unverified on purpose.

CCP and admin signaling | TCP | 443 | Option 1 in the network guide is a domain allow list. Option 2, the AWS IP ranges, is documented as not recommended.

Softphone media | UDP | 3478 | The usual failure string names turn:TurnNlb and port 3478. Media should not hairpin through a VPN.

Return media on a stateless firewall | UDP | Browser ephemeral range | There is no lasting pin. A stateless firewall has to allow the browser’s ephemeral UDP range. The exact range depends on the OS, so this row does not invent a number.

ICE failure symptom | UDP and DNS | 3478 | ice_collection_timeout means the browser never gathered candidates. Resolve TurnNlb from that PC, not from a jump host.

Allow-list proof | TCP and UDP | 443 and 3478 | Test more than 200 calls. An error rate above 2 percent points at proxy or DNS resolution.

Video | Chime media | Not copied here | UNVERIFIED as a port list. The network lesson says video adds a Chime subnet and does not support VDI. Confirm the current port table on the video page before you ticket a firewall change.
