Configuration checklist

Twelve checks before a pilot number takes real traffic.

Instance: Region chosen on purpose. Logging on. Storage bucket and key named.

Identity: SAML assertion carries routing profile, security profile, and role. Test one user.

Numbers: One pilot DID before a port. Caller ID on the queue is a number you may present.

Hours: Queue time zone, not the tester’s laptop. Holiday override for the next closure.

Flows: Error, timeout, and default branches connected. Invoke module for the checks you repeat.

Lambda: Associated with the instance. Resource policy allows connect.amazonaws.com. Returns inside 8 seconds.

Lex: Alias associated. Speech and DTMF both tested. Fallback reaches a person.

Routing: Primary profile priority 1 and delay 0. Overflow has a higher number and a delay.

Recording: Set recording behavior, then confirm one object landed. KMS key policy trusts the service role.

Streams: Agent events and CTRs have a consumer that tolerates duplicates and joins on ContactId.

Network: Endpoint Connectivity tool from an agent PC. Error rate under 2 percent.

E911: Validated address on the agent profile. 933 readback. Security task on a real 911.
